Modelling the piezo-buzzer

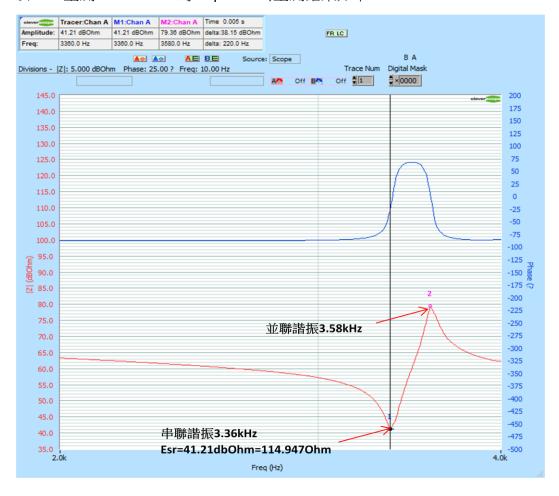

1. 含 Feedback pin 的等效電路:Cp, Ls, Cs, Rs, Co, ns2p. 其中的 ns2p 為 dc transformer 的 turn ratio,目的是提供一 180 度反向的信號

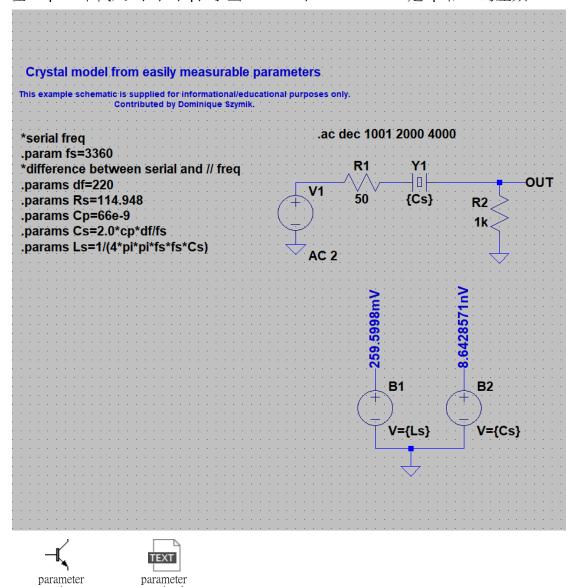

2. 先量測低頻時 FB 短路時的 Cp 約 66nF

3. 以 FRA 量測 2KHz~4KHz 的 impedance,量測結果如下

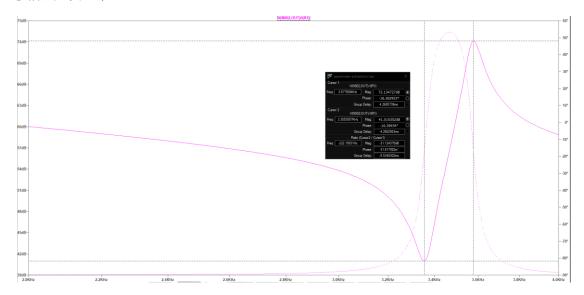

4. 在 LTspice 中代入 fs,df,Rs,Cp, 求出 Cs = 8.6n,Ls = 260mH. Df 是 fp 和 fs 的差頻

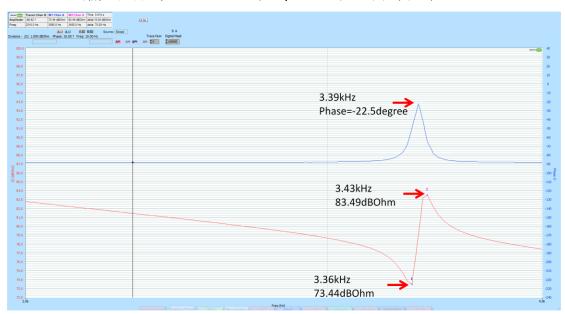

模擬結果如下:

extraction.asc

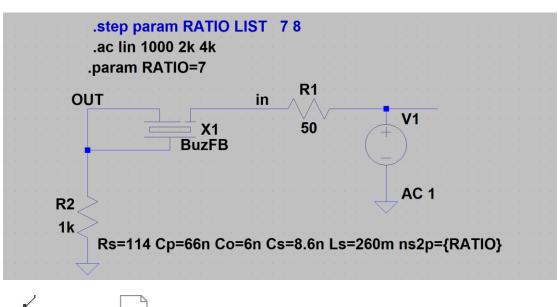

extraction.log

- 5. 量測低頻時輸入短路時的 Co 約 6nF
- 6. 以 FRA 量測輸入短路時 2KHz~4KHz 的 impedance,量測結果如下

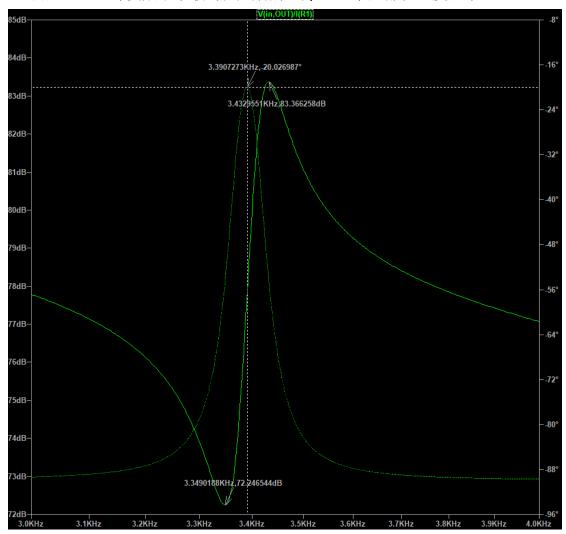

7. LTSPICE 模擬電路如下,調整 RATIO 參數,使其盡量吻合量測結果

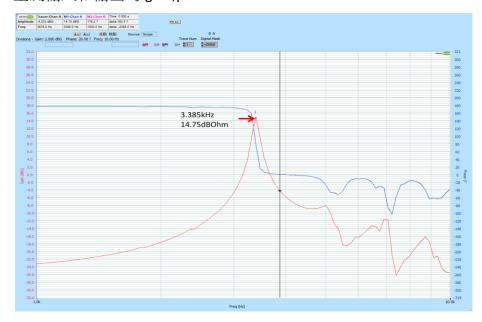

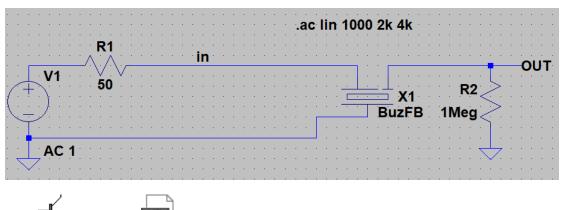

8. 當 RATIO=7 時模擬結果最吻合,可觀察到 phase 永遠都在 0 度以下

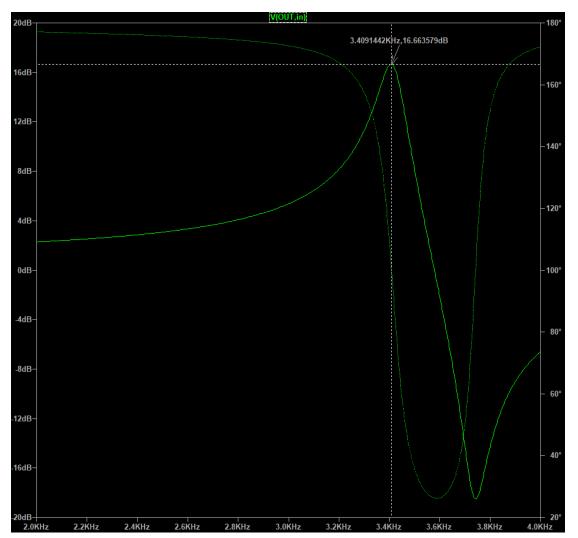

9. 量測輸入和輸出的 gain,phase

10. 模擬電路如下,比對結果在 gain 最大時結果蠻接近的

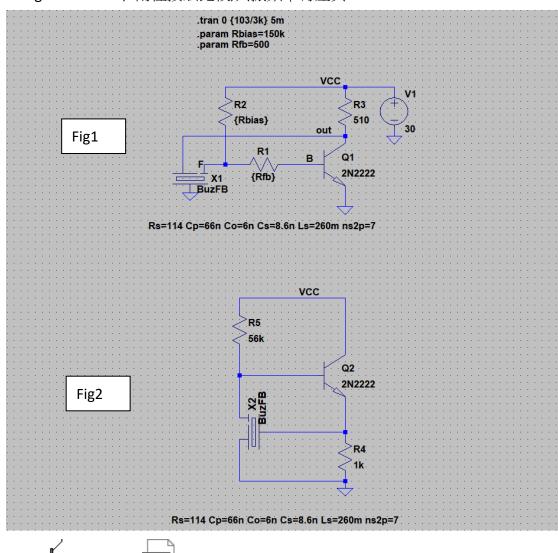

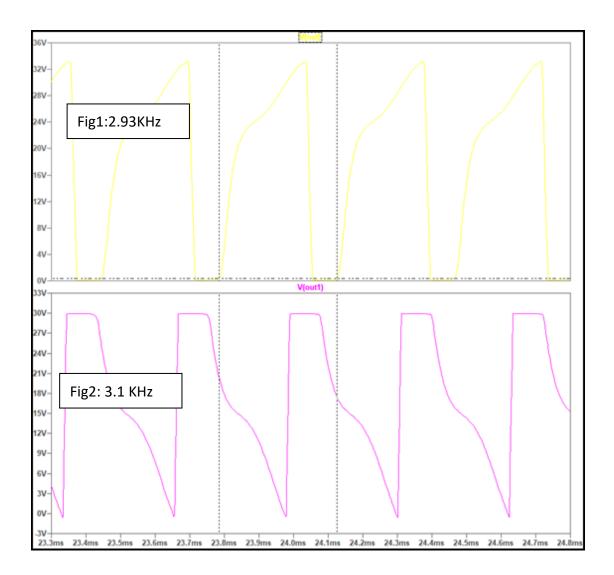

振盪器模擬

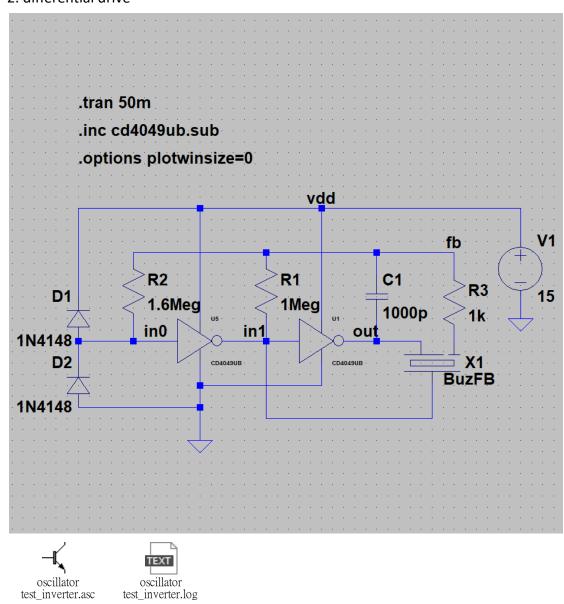

1.single end driver, 兩種接法比較,共振頻率有差異

oscillator test_bjt.log

2. differential drive

模擬結果,頻率為 3.45kHz,比較接近共振頻率
